typeof []

Why an array says object

typeof.js

```
1 console.log(typeof []); // "object"
2 console.log(Array.isArray([])); // true
```

output "object" true

Why it happens

01 Arrays are objects
An array is a special object with number keys and a length.

02 typeof is limited
It only returns string, number, bigint, boolean, symbol, undefined, function, object.

03 No array type
So every array, empty or not, gives "object".

04 Use Array.isArray
It returns true only for real arrays.

Guess the typeof

Classic typeof questions

expression	result
typeof []	"object"
typeof {}	"object"
typeof null	"object" (bug)
typeof function(){}	"function"
typeof NaN	"number"
typeof undefined	"undefined"

Traps to mention

- **instanceof Array can fail** across iframes. Array.isArray always works.
- **Checking objects?** Use x !== null && typeof x === "object" && !Array.isArray(x).

Your 20-second answer

"In JavaScript arrays are objects, so typeof [] returns 'object'. typeof has no array type. To check for an array I use Array.isArray, which returns true only for real arrays and works across frames.
